

AGAT Laboratories 

Jet Fuel Testing and Certification

For over 20 years, **AGAT Laboratories** has provided testing and certification services for the Aviation Fuel industry in Canada. With a state of the art laboratory located in Calgary, Alberta, all our testing is performed according to ASTM standards and certified to the requirements set by the Canadian General Standards Board, CAN/CGSB 3.23.

Being a certified ISO/IEC 17025:2017 and ISO 9001 laboratory, we can support you with verification of quality and performance, and contamination analysis.

Jet Fuel testing can be done:

- Upon delivery, to verify the certificate of quality; or
- After transportation, to confirm cleanliness and lack of contaminants; or
- After long-term storage, to verify usability of the fuel.

Long-term storage of jet fuel can lead to fuel quality and stability issues. Bacterial and fungal growth, gum content, water, and particulate contamination are properties that should be monitored as part of a fuel quality program. If left untreated, any of these can have

a detrimental effect on the fuel. Routine monitoring of these properties is a cost-effective solution to improve fuel longevity.

AGAT Laboratories can provide a complete certification test slate to include all requirements based on CAN/CGSB standards, a basic certification slate, or a simple contamination screening package.
